

**Amendments to the Claims:**

1. (Previously Presented) A method for use of a software application, the method comprising:

creating a mobile data model, the mobile data model explicitly describing one or more data elements, data relationships, data dependencies and data distribution attributes required by a mobile application, wherein the mobile data model is an independent entity, decoupled from a particular interface and enterprise data source;

instantiating at least a portion of the mobile data model to create a mobile data store containing enterprise information;

creating one or more mobile software applications to interact with the mobile data store; and

making the mobile software application and at least a portion of the mobile data model available to a consumer.

2. (Original) The method of Claim 1, wherein the consumer comprises a distributed computing device.

3. (Original) The method of Claim 1, further comprising:

initiating deployment of the mobile software application and the at least a portion of the mobile data model to a plurality of distributed computing devices.

4. (Original) The method of Claim 1, further comprising:

using the mobile data model to create a domain data store in a middle tier server.

5. (Original) The method of Claim 4, wherein a first consumer receiving the mobile software application can access and update data instances in the domain data store using the at least a portion of the mobile data model.

6. (Original) The method of Claim 1, further comprising:

wirelessly deploying the mobile software application to a first consumer.

7. (Original) The method of Claim 1, further comprising:  
developing a distribution rule that identifies a group of consumers; and  
initiating deployment of the mobile software application to the group of consumers.
8. (Original) The method of Claim 1, further comprising:  
using the mobile data model to create a server-side data store; and  
initiating deployment of the mobile software application and the at least a portion of the  
mobile data model to a first consumer, wherein the first consumer after deployment may access and  
update data instances in the server-side data store.
9. (Original) The method of Claim 1, further comprising:  
initiating deployment of the mobile software application and the at least a portion of the  
mobile data model to a first consumer, the first consumer comprising a mobile computing device,  
wherein the first consumer after deployment may wirelessly access data instances of the server-side  
data store.
10. (Previously presented) The method of Claim 9, wherein the first consumer comprises  
a group of mobile workers sharing a job description.
11. (Previously Presented) A system for application development in a mobile domain,  
comprising:  
a middle tier server;  
a domain data store maintained in the middle tier server, the domain data store representing  
enterprise information maintained in an enterprise back end;  
a mobile data model, the mobile data model explicitly describing one or more data elements,  
data relationships, data dependencies and data distribution attributes required by a mobile  
application, wherein the mobile data model is an independent entity, decoupled from a particular  
interface and enterprise data source and operable to enable changes in data structure and data  
handling without requiring programmatic changes in the enterprise back end and wherein the mobile

data model is instantiated on a distributed computing platform to create a mobile data store containing enterprise information; and

an application development engine operable to generate instructions that can be deployed to the distributed computing platform and that allow the distributed computing platform to access information within the mobile data store.

12. (Original) The system of Claim 11 wherein the application development engine is operable to generate object oriented instructions.

13. (Original) The system of Claim 11, further comprising a graphical user interface (GUI) engine responsive to the application development engine.

14. (Original) The system of Claim 11, further comprising:  
a mobile data modeler operable to access the mobile data model; and  
a graphical user interface (GUI) engine operable to present a developer with an interface for the mobile data modeler to modify the mobile data model.

15. (Original) The system of Claim 11, further comprising an enterprise back end system maintaining the enterprise information.

16. (Original) The system of Claim 11, further comprising a distributed computing platform operable to communicatively couple with the middle tier server via a wireless link.

17. (Previously Presented) A system, comprising:  
a distributed computing platform operable to communicate with a middle tier server at least partially across a radio frequency link;  
a memory associated with the distributed computing platform, the memory storing a mobile data store comprising information indicative of information in an enterprise backend, the mobile data store representing an instantiation of at least a portion of a mobile data model, the mobile data model explicitly describing one or more data elements, data relationships, data dependencies and data

distribution attributes required by a mobile application, wherein the mobile data model is an independent entity, decoupled from a particular interface and enterprise data source; and

wherein changes to the mobile data model effect changes in system data descriptions and rules governing data handling without requiring programmatic changes in applications included in an enterprise back-end or mobile device.

18. (Original) The system of Claim 17, further comprising a mobile application operable to interact with the mobile data store.

19. (Original) The system of Claim 18, wherein the mobile application comprises user task specific routines.

20. (Original) The system of Claim 18, wherein the mobile application comprises user specific routines.

21. (Original) The system of Claim 20, wherein the user specific routines are specific to a first user of the distributed computing platform, the system further comprising:

a second mobile application that comprises a second set of specific routines for a second user of the distributed computing platform.

22. (Previously Presented) A method for application deployment, the method comprising:  
establishing a first communication link with a mobile computing device;  
communicating a client-side application and a portion of a deployable mobile data model to the mobile computing device, the mobile data model decoupled from a particular client interface and enterprise data source and capable of independently describing key details required by a client-side application;

disconnecting the first communication link;  
establishing a second communication link with the mobile computing device; and  
receiving transaction data across the second communication link, the transaction data resulting from execution of the client-side application by the mobile computing device at least a

portion of the execution occurring after disconnecting the first communication link and before establishing the second communication link.

23. (Original) The method of Claim 22, further comprising:  
deriving a first mobile data model from an enterprise information system; and  
modifying the first mobile data model to yield the deployable mobile data model.

24. (Previously Presented) A method for application development and deployment, the method comprising:

developing a mobile data model, the mobile data model decoupled from a particular client interface and enterprise data source and explicitly describing one or more data elements, data relationships, data dependencies and data distribution attributes required by a mobile application;

adding at least a portion of the mobile data model to a package;  
including the package in a mobile user application; and  
deploying the mobile user application to a distributed computing device.

25. (Original) The method of Claim 24, further comprising:  
including at least an integration portion of the mobile data model in an application comprising an integration component.

26. (Original) The method of Claim 24, wherein the mobile user application is operable to colonize the distributed computing device and initiate the instantiation of a data store on the distributed computing device, the instantiation described by the at least a portion of the mobile data model added to the package.
